## **Practice questions for Weeks 2-3 learning**

**Question-1:** Create a class called Complex for performing arithmetic with complex numbers. Write a program to test your class.

Complex numbers have the form

```
realPart + imaginaryPart * i
```

Use double variables to represent the private data of the class. Provide a constructor that enables an object of this class to be initialized when it is declared. The constructor should contain default values in case no initializers are provided. Provide public member functions that perform the following tasks:

- a. Adding two Complex numbers: The real parts are added together and the imaginary parts are added together.
- b. Subtracting two Complex numbers: The real part of the right operand is subtracted from the real part of the left operand, and the imaginary part of the right operand is subtracted from the imaginary part of the left operand.

Printing Complex numbers in the form (a, b), where a is the real part and b is the imaginary part.

<u>Question-2:</u> Create a class called Rational for performing arithmetic with fractions. Write a program to test your class.

Use integer variables to represent the private data of the classthe numerator and the denominator. Provide a constructor that enables an object of this class to be initialized when it is declared. The constructor should contain default values in case no initializers are provided and should store the fraction in reduced form. For example, the fraction 2/4

would be stored in the object as 1 in the numerator and 2 in the denominator. Provide public member functions that perform each of the following tasks:

- a. Adding two Rational numbers. The result should be stored in reduced form.
- b. Subtracting two Rational numbers. The result should be stored in reduced form.
- c. Multiplying two Rational numbers. The result should be stored in reduced form.
- d. Dividing two Rational numbers. The result should be stored in reduced form.
- e. Printing Rational numbers in the form a/b, where a is the numerator and b is the denominator.

Printing Rational numbers in floating-point format.

<u>Question-3:</u> Create a class HugeInteger that uses a 40-element array of digits to store integers as large as 40 digits each. Provide member functions input, output, add and substract. For comparing HugeInteger objects, provide functions isEqualTo, isNotEqualTo, isGreaterThan, isLessThan, isGreaterThanOrEqualTo and isLessThanOrEqualToeach of these is a "predicate" function that simply returns TRue if the relationship holds between the two HugeIntegers and returns false if the relationship does not hold. Also, provide a predicate function isZero. If you feel ambitious, provide member functions multiply, divide and modulus.

Question-4: Create a class <code>TicTacToe</code> that will enable you to write a complete program to play the game of tic-tac-toe. The class contains as <code>private</code> data a 3-by-3 two-dimensional array of integers. The constructor should initialize the empty board to all zeros. Allow two human players. Wherever the first player moves, place a 1 in the specified square. Place a 2 wherever the second player moves. Each move must be to an empty square. After each move, determine whether the game has been won or is a draw. If you feel ambitious, modify your program so that the computer makes the moves for one of the players. Also, allow the player to specify whether he or she wants to go first or second. If you feel exceptionally ambitious, develop a program that will play three-dimensional tic-tac-toe on a 4-by-4-by-4 board. [Caution: This is an extremely challenging project that could take many weeks of effort!]
